

## Application

The SBI-445 combination louver features stationary louver blades and an integral gravity operated backdraft damper to protect intake air openings in exterior walls. The SBI-445 is available in a wide array of painted finishes including custom color matching.

## Standard Construction

**Material:** Galvanized steel.

**Frame:** 4" deep × 20 ga. thick (102 × 1) channel.

**Blades:** 45° × 20 ga. (1) thick J-style BD-intake.

**Screen:** 1/2" × 0.063" (12.7 × 1.6) expanded and flattened aluminum.

**Mullion:** Visible.

**Minimum Size:** 12" × 12" (305 × 305)

**Maximum Size:** Single section: 36" × 96" (914 × 2438)  
 Multiple section: Unlimited

## Options

- Factory finish:
  - Polyester Powder
  - Baked Enamel
  - Prime Coat
- 1 1/2" (38) flange frame.
- Welded construction.
- Alternate bird or insect screens.
- Insulated or non-insulated blank-off panels.
- Filter racks.
- Hinged frame.
- Heavy duty 16 ga. (1.6) construction.
- 304 stainless steel construction.

## Ratings

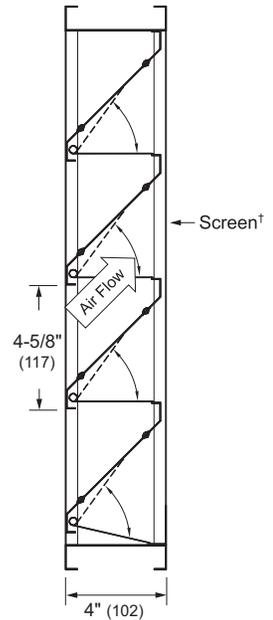

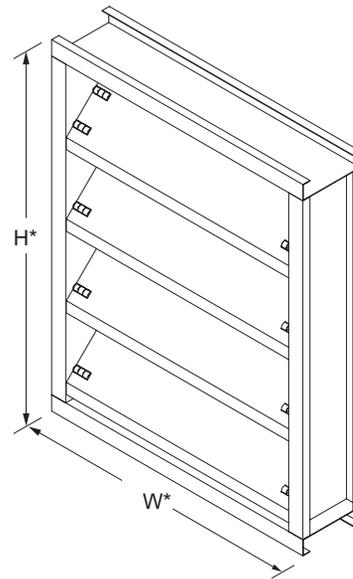

**Free Area:** [48" × 48" (1219 × 1219) unit]: 7.5 ft<sup>2</sup> (0.70 m<sup>2</sup>)  
 46.9%

### Performance @ Beginning Point of Water Penetration

**Free Area Velocity:** 775 fpm (3.94 m/s)  
**Air Volume Delivered:** 5,813 cfm (2.75 m<sup>3</sup>/s)  
**Pressure Loss:** 0.14 in.wg. (35 Pa)

**Velocity @ 0.15 in.wg. Pressure Loss:** 811 fpm (4.12 m/s)

**Design Load:** 30 psf

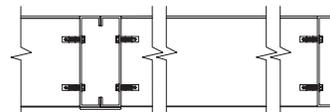

Model **SBI-445**  
 (standard)

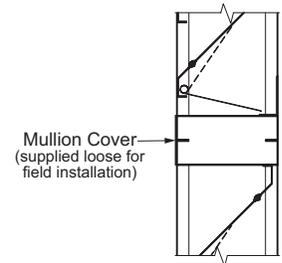

\*Louver dimensions furnished  
 approximately 1/2" (13) undersize.

**Vertical Section**

†Screen adds approximately  
 3/16" (5) to louver depth.

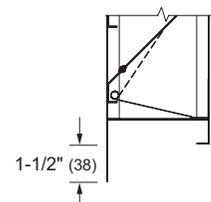

**Vertical Mullion**  
 (standard)

**Horizontal Mullion**  
 (standard)

Mullion Cover  
 (supplied loose for  
 field installation)

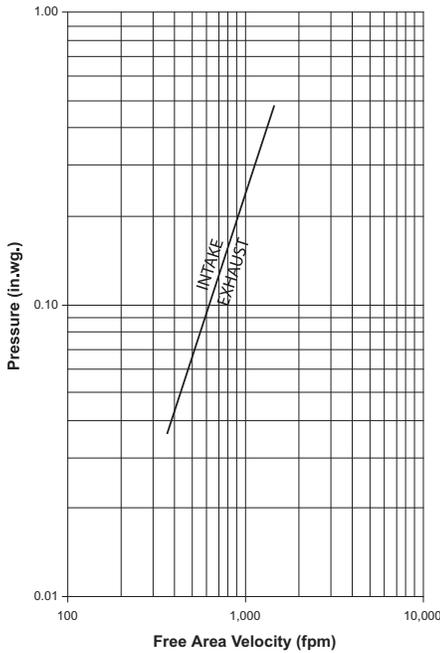

**Flange Frame**  
 (optional)

## Pressure Loss

Louver Test Size = 48" x 48" (1219 x 1219)

**Note:** Operable blades begin to open at 0.07" w.g. (17.4 Pa).  
Operable blades are fully open at 0.25" w.g. (62.1 Pa).  
Louvers Test Size = 24" x 24" (610 x 610).  
Louvers tested with ducted inlet and outlet.

## Water Penetration

AMCA defines the beginning point of water penetration as the free area velocity at the intersection of a simple linear regression of test data and the line of 0.01 ounces of water per square foot of free area and is measured through a 48" x 48" louver during a 15 minute period. The AMCA water penetration test provides a method for comparing louver models and designs as to their efficiency in resisting the penetration of rainfall under specific lab conditions. All-Lite recommends that intake louvers are selected with a reasonable margin of safety below the beginning point of water penetration in order to avoid unwanted penetration during severe storm conditions.

## Selection Criteria

Follow the steps listed below to calculate the louver size needed to satisfy the required air volume while minimizing the adverse effects of water penetration and pressure loss.

1. Determine the Free Area Velocity (FAV) at the maximum allowable pressure loss using the *Pressure Loss* chart to the left. While job conditions vary, typically, the maximum allowable pressure loss should not exceed 0.15 in.wg., and the FAV for 0.15 in.wg. pressure loss is listed on the front page of this sheet.
2. **Intake Applications** If the FAV at the Beginning Point of Water Penetration (shown below) is less than the FAV from step 1, then use the FAV at the Beginning Point of Water Penetration in step 3, otherwise use the FAV from step 1.
- Exhaust Applications** Use the FAV from step 1 in step 3.
3. Calculate the total louver square footage required using the following equation.

$$\frac{\text{Required Air Volume}}{\text{Required Louver (Free-Area) Size in ft}^2} \text{ cfm} \div \frac{\text{FAV}}{\text{fpm}} = \text{ft}^2$$

4. Using the *Free Area* chart above, select a louver width and height that yields a free area ft<sup>2</sup> greater than or equal to the required louver size calculated in step 3.

## Water Penetration

Beginning Point of Water Penetration = 775 fpm
